## Lenz Diagnostic Gauges

The Lenz BAC series of maximum indicating gauges (MID) are ideal for use as diagnostic gauges. The MID option can be used to perform system set up pressures and can be used to detect pressure spikes in the system.

These MID gauges are available in pressure ranges from vacuum up to 15,000 PSI. We also offer BAC-25 (2.5" dial) or BAC-4 (4" dial) series in a bottom or rear connection execution and with NPT or SAE connections.

Our BAC series is designed with a durable forged brass case, and the bourdon tube is brazed into the case which allows it to be used in rugged applications. The glycerin fill combined with Lenz restrictor screw allows the gauge to withstand vibration, pulsation and shocks that can affect the performance of other gauges. This series had U-clamp, front flange options for mounting the gauges.

The MID option is easily reset by turning the thumb screw located on the dial.

We have recently released this feature in our AFC -25 series. Consult factory for more details.
