Suction, Return Flanges and Return Bushings

Lenz SF Suction Flanges, RF Return Flanges, and Return Bushings are designed to seal pipes where they pass through the reservoir top plate.

The Suction and Return Flanges are designed to seal a large hole in the reservoir top, permitting easy access to the reservoir for removal and servicing of suction strainers or other components. The nine pipe sizes available in Suction Flanges are 1/2" through 3" in SF,SFO flange sizes. The six sizes in RF Return Flanges are 1/2" to 2".

Suction and Return Flanges consist of 2 steel stamping flanges, rubber gasket, and are packaged with the necessary seals and screws for easy installation.

The LRB Return Pipe Bushings are manufactured from a nitrile rubber and are the only components required to seal return pipes. They can be specified for either pipe or tube installations. When installed with the pipe inserted through the bushing they reduce vibration and noise and seal the pipe in the reservoir top.

These components are not suited for use below the oil level.
